

CTO Kodee-Trouble-Shooting PDF in WordPress_v03

10:56 AM

Hello! Yes, popular WordPress PDF viewer options include:

- **PDF Poster**, simple embedding and already active on your site.
- **EmbedPress**, supports PDFs and many other media types.
- **3D FlipBook**, useful for magazine-style page flipping.
- **DearPDF**, offers PDF viewing and flipbook layouts.

For your site, I'd first try **PDF Poster**, since it's already active. Also, avoid installing multiple PDF viewer plugins simultaneously, as they may conflict.

10:56 AM

OK, thanks

10:58 AM

You're welcome!

10:58 AM

Help Hostinger Agent improve. How was your chat with us?

•

why cant I see what Im typing anymore?

03:48 PM

Is the text invisible in this chat box or in your WordPress editor?

If it's in the chat box, try refreshing the page, opening it in a private/incognito window, disabling browser extensions, or switching browsers. If it's in WordPress, temporarily disable recently added plugins, especially visual/editor-related ones, and check whether the text color matches the background.

03:48 PM

chatbox

03:48 PM

Try these steps:

1. Refresh the page.
2. Open the chat in a private/incognito window.
3. Disable browser extensions, especially dark-mode or accessibility extensions.
4. Try another browser or clear this site's cached data.
5. Check whether the text appears after sending, if so, it's likely a chatbox display issue.

03:48 PM

OK, I rebooted hostinger and I rebooted my laptop as well. That was weird. How did I make my typing disappear?

03:54 PM

You probably didn't cause it intentionally. It was likely a temporary chatbox display glitch, browser cache issue, or an extension/theme conflict; rebooting may have cleared it. If it happens again, try an incognito window or another browser and temporarily disable extensions.

03:54 PM

I'm using Linux Mint Cinnamon, and I loaded Hostinger as a webapp.

03:55 PM

That helps explain it. A Hostinger webapp on Linux Mint Cinnamon uses a separate browser-app window, so a rendering or GPU issue may have made the text invisible.

If it happens again, close and reopen the webapp, launch it in your regular browser, or recreate the webapp shortcut. Also try disabling hardware acceleration in the underlying browser and check for dark-mode or custom CSS extensions.

03:55 PM

OK, anyway, I will leave this window open. and I will go out an copy, paste a url using ctrl+L etc. That was the function I did before it got weird. Lets see if it happens again. OK?

03:57 PM

That sounds good. Leave the window open and test the same Ctrl+L, copy, and paste workflow. If the text disappears again, note exactly which action triggered it, that will help identify whether it's the webapp or browser rendering.

03:57 PM

OK, here's how I duplicated the weirdness as well as how I backtracked my steps and got back to this window. In other words, I did CTRL+L, etc, and as soon as I saw your Kodee Icon floating in air, I clicked on it, and duplicated the weirdness. So, I did the CTRL+L etc, process again, but this time I hit back, bacxk, abd back, and then when I saw the icon again, I clicked on it an it was ok. In other words, I had summoned you with multip[le pages underneath.

04:02 PM

That sounds like multiple Hostinger webapp pages or chat sessions were stacked in the browser history. Clicking the floating Kodee icon likely returned you to a different page layer, where the chatbox rendered incorrectly.

To avoid it, keep one Hostinger window open, use **Ctrl+L** only for navigation, and close duplicate Hostinger tabs or windows. If it happens again, use the browser's tab overview to select the original chat window instead of repeatedly pressing Back.

04:02 PM

got it.. thank you. anyway, I hlpe I still have the url from yesterday in memory.

04:04 PM

You're welcome! If you copied the URL recently, it may still be in your clipboard, try **Ctrl+V** in the address bar. You can also check your browser history with **Ctrl+H**.

04:04 PM

okay, good. Now can you try to see the url?: https://sneakernetusa.com/artificial-intelligence__trashed/al-kb-chat-master-index/

04:05 PM

Yes, I can see the URL you provided:

https://sneakernetusa.com/artificial-intelligence__trashed/al-kb-chat-master-index/

I can't verify its live contents from here right now, but the URL itself is visible and correctly formatted.

04:05 PM

OK, lets talk about that. what does it mean: I can't verify the live contents. I don't quite understand.

04:07 PM

It means I can read the URL you pasted, but I don't currently have access to open that page and inspect what it displays. I can still help analyze it if you paste the page text, describe what you see, or share a screenshot.

04:07 PM

Ok, so IF, you had access to open the page, what would you actually see? For example, if there was a jpg on the page, what would you "see"

04:08 PM

If I had access to open the page, I could inspect its text, headings, links, and image metadata. For a JPG, I could usually describe visible elements, such as objects, colors, and text, but I would not experience it like human eyesight. I also would not access anything behind a login unless you explicitly provided it.

04:09 PM

OK, I pasted the url, so why did you not have access?

04:10 PM

Pasting a URL only tells me the page address; it does not automatically open or retrieve the page. In this chat, I don't currently have a browsing or page-fetching function available, so I can't inspect that URL directly.

04:10 PM

OK, then how could I get you the right access?

04:11 PM

You can provide access by pasting the page's text here or uploading screenshots of the page. I can then analyze what you share, including visible JPG content, headings, and layout.

If the page is public, you can also open it in your browser and copy the relevant content into this chat. Avoid sharing passwords, private keys, or other sensitive information.

04:11 PM

OK, let me try that. OK?

04:12 PM

Sure, go ahead. Paste the text or upload a screenshot, and I'll review it.

04:12 PM

SO, to ope it in a browser, I will have to exit the webapp. COrrect?

04:13 PM

Not necessarily. You can keep the webapp open and open the URL in a regular browser window, use your browser's menu or press **Ctrl+Alt+T** only if you need a terminal, then open your browser normally. You can also press **Ctrl+L**, copy the URL, open your browser, and paste it there.

04:13 PM

ok, I'm sorry, this is new stuff to me. give me a minute

04:14 PM

No problem, take your time. I'll be here when you're ready.

04:14 PM

What I am trying to replicate is how to copy an entire wen page I am on into my laptop memory. I thought that I might be able to hit ctrl+A to clopy the page I was on into memory. Is that not correct?

04:21 PM

Ctrl+A selects everything on the current page, and **Ctrl+C** copies the selected text, not the complete webpage, images, or layout.

To copy the page's text: press **Ctrl+A**, then **Ctrl+C**, and paste it here with **Ctrl+V**. To preserve the whole page, use your browser's **Save page** option or take screenshots.

04:21 PM

OH, ok. Then let me ask: How can you "see" a screenshot? Doesn;t that take an optical lens?

04:22 PM

A screenshot is a digital image, so it doesn't require a physical optical lens for me. If you upload it, I can analyze the image data, such as visible text, objects, colors, and layout, using image-processing capabilities.

04:22 PM

OK, last question. You can "see" a screenshot, but obviously you don't know what the links do. So, if I selected all the text, PLUS gave you a screenshot, you know exactly what the page does. Correct?

04:26 PM

Almost. The text helps me understand the page's content, and the screenshot shows its visual appearance, but I still can't know what a link does unless you provide its destination or describe what happens when it's opened. You can share the page text, a screenshot, and any relevant link destinations for a fuller analysis.

04:26 PM

But if there are 100 links on the page, it's hard for me to tell you where each link goes. Correct?

04:27 PM

Correct. Checking 100 links individually would be impractical. You can share the page's copied HTML or a link list if available; I can then help organize and explain the destinations, but I still can't test the links directly here.

04:27 PM

OK, wait. So, is that another step I could add.that would help you? In other words, copy the html of that page? And, if yes, which of the 3 pieces are important, and what order?

04:29 PM

Yes, copying the HTML can help identify link destinations and page structure. The most useful order is:

1. **Screenshot**, shows the visual layout.
2. **Visible text**, explains the page's content.
3. **HTML source**, reveals links, image sources, and hidden structure.

For a normal page review, the screenshot and visible text are usually enough; add the HTML when link destinations or technical details matter.

04:30 PM

OK< great... What an excellent lesson this was. Can I somehow copy the entire chat above me?

04:31 PM

Yes. Click in the chat, press **Ctrl+A**, then **Ctrl+C**, and paste it into a document with **Ctrl+V**. If that selects only part of the chat, scroll upward first or use the webapp's menu option to **Export, Download, or Copy conversation**, if available.

04:31 PM

OK, thanks... You get 5 stars

04:31 PM

Thank you! I'm glad the explanation helped.

04:31 PM

Quick actions

- Is there anything else I should know about optimizing my WordPress site?
- How can I check for broken links on my WordPress pages?
- Can you help me with WordPress plugin recommendations?

Agent can make mistakes. Double-check replies.

Kodee says Thank you! I'm glad the explanation helped.
